

B061 System Control Interface Module

The B061 System Control Interface is fully compatible with the Hawkeye range of modules and provides enhanced control as an interface or as a stand alone controller.

Features of the B061 are 16 opto-coupled inputs and 8 relay outputs, good to fail input timers, and input-to-output logic mapping. This means that certain conditions on the input can determine the state of the output relays.

The B061 has a DART* interface for interrogation and control. This provides a simple way of obtaining information from equipment with GPI outputs and feeding it into the DARTnet system, used by Vistek and Avitel. As such it is compatible with Vistek and Avitel frames.

If required, the B061 can utilise remnant (set-reset) relays for the output, so that in the event of failure the remnant relay will ensure that the system will come up in the previous state prior to the power going down.

dB Broadcast also offers the option of customised software for the B061 to match a customer's particular application.
